

Stylized Lava Shader – Documentation

Table of Contents

1. Installation
2. Setup
3. Customization
4. Contact

1. Installation

Import the Unity package into your project.

2. Setup

A ready-to-use material is included: StylizedLavaMaterial. Simply drag this material onto any mesh in your scene.

If you want to create your own material:

1. In the Project tab, right-click and select Create > Material.
2. In the Inspector, set the shader to: Mart 11UP/Substances/StylizedLava.
3. Adjust the properties below to customize the lava appearance.

Note: *You don't need to modify or interact with the shader itself to use this asset. All customizations can be done directly through the material's properties in the Inspector.*

3. Customization

You can tweak the following properties in the Material Inspector to achieve your desired look:

Lava Appearance

- Color – Controls the general color of the lava.
- TextureTiling – Adjusts the tiling of the image texture used.
- NoiseTiling – Controls the density of the noise pattern.
- NoiseDefinition – Defines or blurs the noise shapes.
- NoiseSpeed – Controls the animation speed of the noise.
- FlowSpeed – Controls the movement speed of lava-like flow.

- ShadowFluxSpeed – Controls how quickly the dark areas of the lava expand and contract.

Waves & Mesh Displacement

- WaveSpeed – Controls the speed of wave motion via mesh vertex displacement.
- WaveNoiseTiling – Controls the frequency/density of the waves.
- WaveHeight – Controls the vertical height of the waves.
- NormalStrenght – Controls how much the noise affects the mesh normals (surface detail).

Foam Settings

- FoamColor – Changes the foam color.
- FoamSize – Controls how large the foam areas appear.
- FoamRippleSpeed – Adjusts the movement speed of the foam.
- FoamNoiseTiling – Controls the density of the foam's noise pattern.

Depth Effects

- DeepLavaColor – Sets the color used for fading submerged objects.
- DepthFade – Adjusts how quickly objects fade into the lava depth.
